### Pivot Point Elevator-Series

Durch den Parabelschliff an der Instrumentenspitze und dem rautenförmigen Plateau ist ein schonendes Eindringen in den Interdentalraum bzw. Periodontalspalt optimal gewährleistet. Bedingt durch die Formgebung sind durch 180° Drehung vier Luxationsbewegungen möglich, je 2 x mesial und 2 x distal. Der Hebel arbeitet während des Luxationsvorgangs mit 5-7 Hypomochlien (Dreh- und Stützbewegungen). Dadurch ist er jedem herkömmlichen Hebel deutlich überlegen. Besonders wird die Luxation durch den Wellenschliff am Instrumentenrand begünstigt. Bedingt durch die Formgebung ist eine axial hebelnde Belastung der Instrumentenspitzen zu vermeiden, da dies zu Bruch führen kann.

The elliptically ground area on the instrument tip and the diamond-shaped plateau permit it to penetrate the interdental space and periodontal cleft optimally. Designed for 180° rotation for 4 luxation movements: 2 x mesial and 2 x distal. During luxation, the elevator exerts 5-7 hypomochlions (rotation and supporting actions), which is vastly superior to any conventional elevator. The grooves on the edge of the instrument provide for especially efficient luxation. The instrument tips are not designed for axial leverage as this may cause them to fracture.

Du fait de la taille elliptique de l'extrémité de l'instrument et du plateau losangique, une pénétration atraumatique dans l'espace inter-dentaire ou l'espace parodontal est assurée de manière optimale. La forme même permet aussi, par des rotations sur 180°, d'effectuer 4 mouvements de luxation, 2 du côté distal et 2 du côté mésial. Au cours de la manœuvre de luxation, l'élevateur travaille avec 5 à 7 sites d'hypomochlion (mouvements de rotation et d'appui). De ce fait, cet instrument est de loin supérieur à tout autre élévateur (max. 1 à 2 sites d'hypomochlion). La luxation est particulièrement facilitée par la présence de la taille ondulée dont sont pourvus les bords tranchants de l'instrument. Du fait de la forme de l'instrument, il faut éviter de soumettre l'extrémité de l'instrument à un effort de levier car cela peut provoquer sa fracture.

El rectificaco elíptico sobre la punta del instrumento y la plataforma romboidal permiten la inserción óptima, no agresiva, en el espacio interproximal o el resquecio periodontal. El diseño del instrumento posibilita 4 movimientos de luxación al realizar un giro de 180°: 2 x mesial y 2 x distal. La palanca trabaja con 5-7 movimientos de giro y apoyo. Por este motivo es superior a cualquier palanca convencional. (máx 1-2 movimientos de giro y apoyo). La luxación es favorecida particularmente por la ondulación mecanizada sobre el margen del instrumento. Por la forma de los instrumentos deberá evitarse una carga de palanca axial sobre las puntas de los mismos, puesto que esto podría provocar su rotura.

### Luxator

Instrumente zum Durchtrennen der zahnfixierenden Ligamente. Die sehr flache und scharfkantige Form der Arbeitsenden erlaubt ein schonendes Eindringen in den Parodontalspalt. Hier wird der Luxator in ausschließlich rotierender und schneidender Bewegung eingesetzt und dadurch die Alveole schonend erweitert.

Das traditionelle horizontale Aushebeln birgt hohe Bruchgefahr. Ein vertikales Aushebeln ist mit den traditionellen Hebeln nur bedingt möglich. So ist mit der Konstruktion der Luxatoren eine nahezu ideale Synthese zwischen traditionellem Hebel und Periostom gelungen. Unterstützend wirkt vor allem die negative Krümmung.

### Luxators

Dental instrument to sever tooth-fixed ligaments. The extremely flat and sharp edged form of the working ends allows a very gentle penetration into the periodontal gap. Here, the luxator is used only in a rotating and cutting manner and allows a very gentle widening of the alveole.

### Luxateurs

Le Luxateur est un instrument destiné à l'extraction par une technique de séparation des tissus et de la dent qui a la même fonction qu'un élévateur. Cet instrument possède une lame extra-plate et tranchante de manière à sectionner les ligaments.

Par des mouvements de rotations et de coupe il mobilise la dent à l'inverse de l'élévateur qui élève, mobilise et sert de levier. L'avantage du Luxateur est, qu'il diminue les traumatismes exercés sur la dent et les tissus adjacents.
